Primer Fuego Studio publisher — OAuth and upload flow

API client: "Primer Fuego Studio publisher" · Google Cloud project 497247365875 · Operator: Tomas Pombo (Primer Fuego Studio), Bahía Blanca, Argentina · Website: https://vibrasagencyes-png.github.io/primer-fuego-studio/

> The API client is an internal command-line tool that runs only on the studio owner's computer. It has no web interface, no public sign-up and no third-party users. It only manages the studio's own two YouTube channels: **El Primer Fuego** (youtube.com/@ElPrimerFuegoDoc) and **Das Erste Feuer** (youtube.com/@DasErsteFeuer).

1. OAuth 2.0 consent (installed-app flow)

The owner connects each channel once. The tool opens Google's standard consent screen in the browser; the owner selects the Google account and the brand channel and grants access. No credentials are typed into the tool.

```
$ python3 subir.py autorizar --canal el-primer-fuego
Se abre el navegador: elegí la cuenta y el CANAL 'el-primer-fuego'.
# Google consent screen: "Primer Fuego Studio wants to access your Google Account" → account
el.keco.peke@gmail.com → channel "El Primer Fuego" → Continue
✅ el-primer-fuego → «El Primer Fuego» (UCER7_361PKQTslGTQhntd9A) · 0 subs · 0 videos
```

Scope requested	Why
https://www.googleapis.com/auth/youtube.upload	Upload the studio's own documentaries (videos.insert).
https://www.googleapis.com/auth/youtube	Set thumbnails (thumbnails.set), create playlists and add the studio's videos to them, read the connected channel (channels.list, videos.list).
https://www.googleapis.com/auth/yt-analytics.readonly	Read aggregated analytics of the studio's own channels to plan future episodes.

Tokens are stored only on the owner's computer (motor/credenciales/tokens/<channel>.json, not shared).

2. Revocation

Access can be revoked at any time at **https://myaccount.google.com/permissions** (Third-party apps & services → "Primer Fuego Studio" → Remove access). After revocation the stored token stops working and the tool asks to run `autorizar` again. Locally stored analytics are deleted after 24 months, as stated in the privacy policy.

3. Upload interface (command line)

Each documentary is a folder with the video, thumbnail and metadata. The tool uploads it to the studio's own channel and schedules publication.

```
$ python3 subir.py video ../cola/el-primer-fuego/2026-10-08-invierno-edad-de-hielo
# videos.insert, resumable upload
   subiendo 25%
   subiendo 50%
   subiendo 75%
   subiendo 100%
  ✅ subido: https://youtu.be/<videoId>
# then thumbnails.set (miniatura.jpg) and playlistItems.insert (if a playlist is set)
# status sent: privacyStatus private + publishAt (scheduled), containsSyntheticMedia true,
selfDeclaredMadeForKids false
```

Metadata sent with each upload	Source
Title, description (with chapters and scientific sources), tags, category 27, default language	meta.json written by the studio
Thumbnail	miniatura.jpg produced by the studio
Altered or synthetic content disclosure	Always declared (AI-generated narration and visuals)

4. Analytics (internal report)

```
$ python3 metricas.py --canal el-primer-fuego --dias 28
# YouTube Analytics reports.query for the studio's own channel: views, estimatedMinutesWatched,
# averageViewDuration, subscribersGained → saved as a local report to plan the next episodes
```

5. Expected usage

About 6 uploads per week in total (3 per channel), each with one thumbnails.set call; weekly analytics reads; occasional search.list for topic research. Estimated well under 1,000 requests per day.
